

target journals (all open access; impact factor from clarivate 5 yr):

- Earth Interactions (Joint AMS and AGU)
 - ◊ 7500 words (no figure limit)
 - ◊ IF: 2.4
 - ◊ AMS LaTeX template
- J. Climate (AMS)
 - ◊ 7500 words (no figure limit)
 - ◊ IF: 5.3
 - ◊ AMS LaTeX template
- Journal of Great Lakes Research (Elsevier)
 - ◊ no template
 - ◊ IF: 2.6
 - ◊ no limit

abstract

Intro & Background

- Introduction to Great Lakes and description of lake/atmosphere interactions
- Importance of lake ice in the region (economic, weather, fish)
- Description of ice cover variability
- Cite previous work that addressed temperature change, ice cover change
- Introduction to GLAHF and background info Mason et al 2015
- Motivation for analyzing ice cover at sub-regional scales
- Importance for understanding physical correlations as a means to understand causation
- Outline two components of this work:
 - ◊ trend assessment
 - ◊ meteorological correlation

Data & Methods

- Definition of metrics (AMIC, JFM, duration) and justification
- Physical explanations of how met vars can influence ice cover (e.g. wind-driven mixing physics)
- Statistical
 - ◊ AMS LaTeX template

Miscellaneous random thoughts: more than an “update” to mason et al 2016: drastic years since 2013 focus on correlations based on >1K GHCND and ISD stations - *air* temp/tdew - wind - precip - cloud cover

looking at Max Ice and JFM average
